Deoxyribonucleic acid, 9CI, D-361 8CI**DNA. Thymus nucleic acid**

A polynucleotide constructed from chains of 2-deoxy-D-ribose purine and pyrimidine units linked by phosphate diester bonds between the 3'- and 5'-hydroxyls of adjacent sugars. DNA from viruses have molecular weights ca. 1-130 × 10⁶ whereas bacterial and animal DNA has much higher molecular weights with chains easily severed during isoln. The adenine and thymine contents are equal and the guanine and cytosine contents also equal, regardless of source. In the secondary structure two polymer chains form right-handed helices about a common axis, with the sequence of atoms running in opposite directions in each strand. The bases are inside the helix and the adenine of one chain is hydrogen bonded to the thymine of the other and similarly with the guanine and cytosine. Present in all life forms except some viruses. An essential component of chromosomes in cell nuclei which carries genetic information by containing a chemical code in its structure, which is exactly reproducible. The linear sequence of bases in one strand determines the sequence in the other. Thus each strand can serve as a template for replication of the original DNA molecule. DNA also serves as a template for the formation of ribonucleic acids.

Dermatan sulfate, 9CI**D-387**Chondroitinsulfuric acid type B. β -HeparinC₁₄H₂₁NO₁₄S 459.384

A mucopolysaccharide composed of L-Iduronic acid, N-Acetylgalactosamine 4-sulfate linked(1→3) and (1→4) plus small amounts of D-Glucuronic acid. Polymeric. Minimum formula given. Found in skin, blood vessels, heart valves, tendons, aorta, spleen and

brain. Usually isol. from pig skin or beef lung tissue. Large amounts are stored in tissue of subjects with Hurler's syndrome and are excreted in the urine. Anticoagulant and antithrombotic agent. [α]_D -55 (H₂O). MW = 2-5 \times 10⁴.

Desmin 370 [24967-94-0]

Low MW dermatan sulfate (5500D \pm 500D). Anticoagulant and antithrombotic agent. Prepared by controlled depolymerisation using H₂O₂/Fe²⁺ or other metal ions.

Care needed with nomenclature and numbering. Shown here numbered as pyrans. If named as carbohydrates, it is preferable to consider all stereoisomers as hex-1-enitols, in which case positions 2,3,4 become 5,4,3 respectively. Strict application of the IUPAC special rules for carbohydrates would mean that some of the stereoisomers would be named as hex-5-enitols not hex-1-enitols (e.g. 2,6-anhydro-1,5-dideoxy-arabino-hex-5-enitol is preferred over 1,5-anhydro-2,6-dideoxy-lyxo-hex-1-enitol), in which case 2,3,4- remain 2,3,4- but with the Me group not the O atom numbered 1.

C₄H₈O₄ 120.105

D-form

(2R,3R)-form
[583-50-6]

An intermed. in the Embden-Meyerhof glycolysis and alcohol fermentation scheme. Found in ferns and tobacco. Syrup. [α]_D²² -43.5 (c, 1 in H₂O). Exists in dilute aq. soln. as a mixt. of the hydrate and furanose forms. Concentration of the soln. causes dimerisation.

Phenylosazone:

Needles (C₆H₆). Mp 164°.

4-Phosphate: [585-18-2]

C₄H₉O₇P 200.085

Occurs in trace amounts in muscle. Important intermediate in the Embden-Meyerhof-Parnas metabolic pathway.

Fructans**F-43**

A series of straight-chain and branched-chain glucose-fructose oligomers of which the simplest member is Sucrose, S-92. One straight-chain series consists of 6-Kestose, K-14 and higher members such as 6,6-Kestotetraose. The lower members of other series are exemplified by Neokestose, N-20, Nystose, N-87, Bifurcose, B-32 and 1-Kestose, K-13. All members characterised contain one terminal glucose residue and a variable number of fructose residues in a straight-chain or branching pattern. Accumulate during vegetative and reproductive growth of cereal grasses and other plants.

α-D-Pyranose-form

C₆H₁₂O₆ 180.157

Equilib. difficult to study, but an aq. soln. prob. contains approx. 70-75% β-Pyr, 20-23% β-Fur, 5% α-Fur, 0-2% α-Pyr and 0-0.7% open-chain forms. In Py and DMSO soln. there are higher proportions of furanose forms. α-Acrose was apparently an old synonym for the racemate.

D-form [57-48-7]

Prepd. on large scale from invert sugar (hydrol. prod. of sucrose with dil. acid) or hydrolysed natural inulins. Fructose can be separated from glucose by precipitation of its Ca salt complex. Inulin from dandelion roots has also been used as a source. Occurs in honey, a large number of fruits, particularly apples and tomatoes, and detected in mammalian semen. Present in polymeric form in the inulins, the energy reserve polysaccharides of many plants, e.g. dahlia and Jerusalem artichoke tubers, and in Levan, L-34 which is found in grasses. Sucrose consists of fructofuranose glycosidically linked to the anomeric centre of D-glucopyranose. Fluid and nutrient replenisher, nutritive sweetener.

Mp 102-104°. [α]_D -133.5. [α]_D -92.4 (c, 4 in H₂O). pK_{a1} 12.03 (25°). Sweetness = 0.84 × sucrose (sometimes stated to be sweeter than sucrose).

Fucoidan, 9CI, 8CI. Fucosidan [9072-19-9]

A polysaccharide containing L-fucose and half sulphate ester. Small amounts of galactose, xylose and uronic acid are present. Two possible components are illustrated. The precise struct. of fucoidin in variants remains unclear (2000). Present in the intercellular tissues and surface exudates of Phaeophyceae, although the amount in some spp. is exceedingly small. The polysaccharide content varies with the depth at which the plant is located. *Pelvetia canaliculata* contains about 23% of the dry weight while in permanently submerged *Laminaria* it is <7%. V. hygroscopic, may prevent dehyd. of the plant upon long exp. Shows a range of biol. activities incl. antitumour and antiviral. [α]_D -118.

D-form [59-23-4]

The free sugar has been detected in ivy berries, some fruits and heartwood of *Chamaecyparis lawsonia*. It is a constit. of the oligosaccharides Lactose, L-13, 6-O- α -D-Galactopyranosyl-D-glucose, G-145 and Raffinose, R-1, the glycosides Idacine and Myrtilin and the cerebroside and gangliosides of brain and nerve tissue. It is one of the few sugars, other than D-Glucose and 2-Deoxy-D-ribose, found to any great extent in the animal kingdom, a common constit. of glycoproteins and the galactans of beef lung, frog spawn and snail (*Helix pomatia*) albumin gland. Polysaccharides agar, gum arabic, mesquite gum, western larch gum and many plant mucilages and gums contain galactose. Can be prepd. by acid hydrol. of lactose, being isol. after the glucose has been removed by yeast fermentation. Inexpensive starting material for synthesis.

Gangliosides

G-214

A large class of glycosphingolipids composed of hexoses, Sphingosine, fatty acids and sialic acids. The differences between the gangliosides are mainly in the carbohydrate moieties. Four major gangliosides referred to as GM₁ (illus.), DD_{1a}, GD_{1b}, GT_{1b}. Found in the CNS and widely distributed in other tissues. Gangliosides are the main cause of cell surface negative charge. They are also thought to be involved in many different cell functions e.g. metabolism, growth and malignant transformation. A monoganglioside prep. has been used in the treatment of cerebrovascular disorders.

Ganglioside GM₁

Ganglioside G₁. Siagosome. Sygen
[37758-47-7]

C₇₃H₁₃₁N₃O₃₁ 1546.839

Isol. from bovine brain. Constit. of mammalian vertebrate cell membranes. Particularly abundant in the central and peripheral nervous systems. Used in the treatment of peripheral neuropathies, cerebrovascular disorders and spinal cord injury. Positive effects still need to be confirmed. Now used in the treatment of Parkinson's disease.

For stereoisomers see Allitol, A-75, Galactitol, G-4, Iditol, I-3, Mannitol, M-25 and Talitol, T-3. Sorbitol is a common trivial name for glucitol but is imprecise and should be discouraged. Reduction of sorbose can produce either glucitol or iditol. Furthermore, D-glucitol is usually referred to as D-sorbitol whereas reduction of D-sorbose gives L-glucitol.

[50-70-4]

Occurs widely in plants ranging from algae to the higher orders. Fruits of the plant family Rosaceae, which include apples, pears, cherries, apricots, contain appreciable amounts. Rich sources are the fruits of the *Sorbus* and *Crataegus* spp. Used for manuf. of sorbose, propylene glycol, ascorbic acid, resins, plasticisers and as antifreeze mixts. with glycerol or glycol. Tablet diluent, sweetening agent and humectant, other food uses. Used in photometric detn. of Ru(VI) and Ru(VIII); in acid-base titration of borate.

Needles + $\frac{1}{2}$ or H_2O (EtOH) with sweet taste (60% of sucrose). Freely sol. H_2O ; fairly sol. hot EtOH; spar. sol. cold EtOH. Mp 92° (labile form) Mp 97° (stable form) Mp 110-112° (anhyd.). $[\alpha]_{\text{D}} +7$ (borax). $[\alpha]_{\text{D}} +31$ (molybdate). pK_a 13 (60°). The name D-Sorbitol has been used for this compound but should not be employed (see above). Several polymorphs known.

D-form [50-99-7]

[5996-10-1]

Most common sugar, abundant in free and combined form. Occurs free in blood, cerebrospinal fluid, lymph, urine of diabetic subjects, fruits, honey and plant juices. Major component of many oligosaccharides and polysaccharides. Occurs in sucrose combined with fructose. Comly. available by the acid hydrol. of potato starch (Europe) and cornstarch (USA). Fluid and nutrient replenisher. Food additive: nutritive sweetener, humectant. Tablet diluent. pK_{a1} 12.34 (25°). Sweet taste, sweetness = 0.46 × sucrose.

- Reacts violently with Na₂O₂ plus KNO₃, and other strong oxidants. LD₅₀ (rat, orl) 25800 mg/kg. Human and exp. reprod. and teratogenic effects (large doses). LZ6600000

Glucose 1-dihydrogen phosphate G-517

Glucose-1-phosphate. Cori ester

α -D-Pyranose-form

$C_6H_{13}O_9P$ 260.137

D-form [59-56-3]

Found widely in both plants and animals. A precursor of starch in plants and of glycogen in animals.
 $[\alpha]_D^{25} +120$ (H₂O). pK_{a1} 1.11; pK_{a2} 6.13 (30°).

α -D-Pyranose-form

Ba salt: $[\alpha]_D^{25} +75$ (c, 1.2 in H₂O). Forms a trihydrate.

Di-K salt: [29732-59-0]
 [5996-14-5] $[\alpha]_D^{20} +78$ (c, 4.0 in H₂O). Forms a dihydrate.

 α -Pyranose-form

$C_6H_{10}O_7$ 194.141

D-form [6556-12-3]

Widely distributed in plants, where it occurs in gums, mucilages, saponins and flavone glycosides and in animals as a constit. of mucopolysaccharides. Glycosides are formed in the liver to detoxify poisonous hydroxyl-containing substances. Phenyl, cresyl and indoxyl glycosides are present in normal urine. Used in hplc to determine enantiomeric purity of dopamine agonists.

Heparinic acid. Fragmin. Pabryn. Many other names
[9005-49-6]

A polymer composed mainly of two disaccharide repeating units A and B. A is L-Iduronic acid 2-sulfate linked α-(1→4) to 2-Deoxy-2-sulfamido-D-glucose 6-sulfate while B is D-Glucuronic acid β-(1→4) linked to 2-Deoxy-2-sulfamido-D-glucose 6-sulfate. MW 5000-15000. See also 2-Amino-2-deoxy-α-D-glucopyranosyl-(1→4)-β-D-glucopyranosyluronic acid-(1→4)-2-amino-2-deoxy-α-D-glucopyranosyl-(1→4)-α-L-idopyranosyluronic acid-(1→4)-2-amino-2-deoxy-D-glucopyranose, A-255. Occurs in the blood, skin, aorta, umbilical cord and in most tissues and is supposedly manuf. by the mast cells. Has anticoagulant and thrombolytic action. Used in the manuf. of blood-compatible polymers for use as prosthetic materials. [α]_D +44 (H₂O). A variable fraction of the heparin chains are linked to serine or small peptides and contain the specific carbohydrate-protein linkage region (→ GlcUA → Gal → Gal → Xyl → Ser) identical with that found in several other connective tissue polysaccharides. The presence of this linkage region suggests that Heparin is synthesised *in vivo* as a proteoglycan. Na salt of depolymerised heparin obtained by nitrous acid degradn. of heparin from pork intestinal mucosa known as minolteparin sodium, INN, a low MW heparin.

Hexosazones

(3R,4R,5R)-form

 $C_{18}H_{22}N_4O_4$ 358.396

Formed from aldohexoses by treatment with phenylhydrazine. The reaction involves a formal oxidation step involving destruction of the chiral centre at C-2. The eight (enantiomeric pairs of) hexoses therefore form a total of four different osazones. In addition, the four ketohexoses form the same osazones by formal oxidation at C-1. Key compds. for historical characterisation of the hexoses and their configurational interconversion (Fischer, 1889). Readily converted into osotriazoles which can be used for further characterisation.

C₁₄H₂₁NO₁₁ 379.32

A mucopolysaccharide composed of N-Acetylglucosamine and D-Glucuronic acid. MW= 1–8 × 10⁶. Polymeric. Minimum formula given. Found in the extracellular matrix of all higher animals, esp. in soft connective tissues. Isol. from synovial fluid, amniotic fluid, etc. Functions as a joint lubricant and shock absorber; used in the treatment of synovitis and osteoarthritis. - $C_{18}H_{30}O_{17}$ 518.425
Isol. from cell cultures of *Rosa* sp.
- 2-Ac: 2-O-Acetyl-myoinositol. **Campanulitol**. *Campanulite* [41929-24-2]
 $C_8H_{14}O_7$ 222.194
Isol. from *Campanula cephalotes*.
Prismatic cryst. (H_2O).
Mp 193-195°. Achiral.
- 1,4,5,6-Tetra-Ac: 1,4,5,6-Tetra-O-acetyl-myoinositol
[108032-48-0]
[90366-30-6]
 $C_{14}H_{20}O_{10}$ 348.306
Cryst. ($CHCl_3/Et_2O$). Mp 143-144° (hemihydrate). $[\alpha]_D^{20} +5$ (c, 0.9 in $CHCl_3$).
Chiral D-form. Racemate also known (Mp 138-140°, as hemihydrate).
- 3,4,5,6-Tetra-Ac: [80953-32-8]
 $C_{14}H_{20}O_{10}$ 348.306
Cryst. ($CHCl_3/Et_2O$). Mp 143-144°. $[\alpha]_D^{20} -6.7$ (c, 3.0 in $CHCl_3$). Chiral, D-form.
- 1,2,3,4,6-Penta-Ac: 1,2,3,4,6-Penta-O-acetyl-myoinositol
 $C_{16}H_{22}O_{11}$ 390.343
Mp 178°. *Meso*-.
- 1,3,4,5,6-Penta-Ac: [52389-41-0]
 $C_{16}H_{22}O_{11}$ 390.343
Prisms (EtOH). Mp 170-173°. *Meso*-.
- Hexa-Ac: Hexa-O-acetyl-myoinositol
[1254-38-2]
 $C_{18}H_{24}O_{12}$ 432.38
Mp 216-217°. *Meso*-.
- 1,2,4,5-Tetra-O-angeloyl: [82729-35-9]
 $C_{26}H_{36}O_{10}$ 508.564
Constit. of *Inula cappa*.
- 1,2,4,6-Tetra-O-angeloyl: [82729-36-0]
 $C_{26}H_{36}O_{10}$ 508.564
Constit. of *Inula cappa*. Gum. $[\alpha]_D^{24} +3.4$ (c, 0.7 in $CHCl_3$).
- 2-O-(2-Methylbutanoyl), 1-O-angeloyl: [129744-02-1]
 $C_{16}H_{26}O_8$ 346.377
Constit. of *Hymenoxys texana*.
- 6-O-(2-Methylbutanoyl), 1-O-angeloyl, 2,3-di-Ac: [129744-00-9]
 $C_{20}H_{30}O_{10}$ 430.451
Constit. of *Hymenoxys texana*.
- 6-O-(2-Methylbutanoyl) 1-O-angeloyl, 3-O-(3-methyl-2-butanoyl), 2-Ac: [129744-01-0]
 $C_{23}H_{34}O_{10}$ 470.516
Constit. of *Hymenoxys texana*.
- 2,3-Bis-O-(2-methylbutanoyl), 6-O-angeloyl: 6-Angeloyl-2,3-bis(2-methylbutanoyl)-myoinositol
 $C_{21}H_{34}O_9$ 430.494
Constit. of *Viguiera quinqueremis*.
- 1,4-Dibenzoyl:
 $C_{20}H_{20}O_8$ 388.373
Cryst. (DMF aq.). Mp 253-254°.
- 1,6-Dibenzoyl: [162062-54-6]
 $C_{20}H_{20}O_8$ 388.373
Cryst. (2-propanol). Mp 101-103°.
- Hexabenzoyl: Hexa-O-benzoyl-myoinositol
[4099-90-5]
 $C_{48}H_{36}O_{12}$ 804.805
Mp 258°. *Meso*-.
- 6-O-(4-Hydroxy-Z-cinnamoyl): 6-O-cis-p-Coumaroyl-myoinositol
 $C_{15}H_{18}O_8$ 326.302
Constit. of the seeds of *Taxus mairei*.
Amorph. powder.
- Hexakis(3-pyridinecarbonyl): **Inositol nicotinate**, **BAN**, **INN**. Inositol niacinate, **USAN**. Inositol hexanicotinate, **JAN**. Hexanicotinoylinositol. **Hexopal**. **Linodil**. **Lipoflavonoid**. **Mesonex**. **Palohex**. **NSC 49506**. **Win 9154**. Many other names
[6556-11-2]
 $C_{42}H_{30}N_6O_{12}$ 810.732
Peripheral vasodilator, antilipidaemic agent. Mp 254-255°. Log P 1.77 (calc). *Meso*-.
- LD₅₀ (rat, scu) 1180 mg/kg. NM7535400
- 1,2-Ethylidene: 1,2-O-Ethylidene-myoinositol
 $C_8H_{14}O_6$ 206.195
Mp 120-122°. DL-form.
- 1,2-O-Isopropylidene: 1,2-O-Isopropylidene-myoinositol
[26276-97-1]
 $C_9H_{16}O_6$ 220.222
Cryst. (EtOH). Mp 182-184°. *Meso*-.
- 1,2,3,4-Di-O-isopropylidene: 1,2,3,4-Di-O-isopropylidene-myoinositol
[115116-20-6]
 $C_{12}H_{20}O_6$ 260.286
Solid (petrol/EtOAc). Mp 150-152°. Chiral compd.; props. refer to racemate.
- 1,2,3,4-Di-O-isopropylidene, di-Ac: 4,5-Di-O-acetyl-1,2,3,6-di-O-isopropylidene-myoinositol
[115116-25-1]
 $C_{16}H_{24}O_8$ 344.361
Mp 140-142°. Chiral compd.; props. refer to racemate.
- 1,2,4,5-Di-O-isopropylidene: 1,2,4,5-Di-O-isopropylidene-myoinositol
[98974-89-1]
 $C_{12}H_{20}O_6$ 260.286
Mp 174°. Chiral compd.; props. refer to racemate.
- 1,2,5,6-Di-O-isopropylidene: 1,2,5,6-Di-O-isopropylidene-myoinositol
[115116-18-2]
 $C_{12}H_{20}O_6$ 260.286
Mp 172-175°. Chiral compd.; props. refer to racemate.

[115116-19-3]
 $C_{16}H_{24}O_8$ 344.361
Mp 165-168°. Chiral compd.; props. refer to racemate.
- 1,2,5,6-Di-O-isopropylidene, dibenzoyl: 1,6-Di-O-benzoyl-2,3,4,5-di-O-isopropylidene-myoinositol
[115072-66-7]
 $C_{26}H_{28}O_8$ 468.502
Solid (MeOH). Mp 197-200°. Chiral compd.; props. refer to racemate.
- 1,2-O-Cyclohexylidene: 1,2-O-Cyclohexylidene-myoinositol
[6763-47-9]
 $C_{12}H_{20}O_6$ 260.286
Solid (EtOH/Et₂O). Mp 179°. Chiral compd.; props. refer to racemate.
- 1,2,5,6-Di-O-cyclohexylidene: 1,2,5,6-Di-O-cyclohexylidene-myoinositol
[33021-17-9]
 $C_{18}H_{28}O_6$ 340.416
Mp 153-156°. $[\alpha]_D^{20} -7.4$ (c, 0.5 in C_6H_6). Chiral compd. Racemate Mp 133°.
- 1,3,5-O-Methylidyne: myo-Inositol mono-orthoformate
[98510-20-4]
 $C_7H_{10}O_6$ 190.152
Cryst. (MeOH). Mp 300-302° (sealed tube). *Meso*-.
- 4-Benzyl:
 $C_{13}H_{18}O_6$ 270.282
Cryst. (EtOH). Mp 173°. $[\alpha]_D^{24} +6.1$ (c, 0.5 in MeOH).
- 5-Benzyl: [92217-63-5]
 $C_{13}H_{18}O_6$ 270.282
Cryst. (EtOH). Mp 286°. *Meso*-compd.

Dahlin. Plant starch
[9005-80-5]

n approx. 30, MW approx. 5000. Contains Inulobiose, I-39 as a repeating structural unit with mostly glucose as terminal group. Yields D-Fructose and D-Glucose on acid hydrol. Replaces starch as a reserve food in Jerusalem artichoke (*Helianthus tuberosus*) and in other members of Compositae. Also present in a few Campanulaceae and Lobeliaceae. Diagnostic aid for kidney function. $[\alpha]_D^{20}$ -40 (c, 2.0 in H₂O). Log P -7.77 (uncertain value) (calc). For other related storage polysaccharides see Levan, L-34, Sinistrin, S-44 and Phleam, P-66. Other storage polysaccharides which have been isol. from various species and given trivial names include Secalin and Asparagodin from asparagus.

Levan

[9013-95-0] A large variety of bacterial strains (*Aerobacter levanicum*, *Pseudomonas prunicula*, *Corynebacterium* sp., and a strain of *Bacillus subtilis*), produce levans when grown on sucrose in a suitable nutrient medium. Also a constit. of grasses. Has a number of developing industrial uses. [α]_D²⁰ -43. Levans in grasses contain essentially linear chains of =20-30 2,6-linked β-D-fructofuranose units terminated in most cases by a nonreducing glucopyranose residue. Some grass levans may contain a single branch point. In contrast, the levans elaborated by bacteria are of much higher molecular weight. Although the major linkage is of the 2,6-type, the polysaccharides are branched and contain unit chains =10-12 residues joined at the branching points by 2,1-linkages.

L-40

Chemical structure of a substituted pyrrolidine derivative. The pyrrolidine ring has a methyl group (Me) on the nitrogen and a substituent R at the 4' position. The 2-position of the pyrrolidine is connected via a carbonyl group (CONH) to a chiral center. This chiral center is also bonded to a methyl group (CH₃), a hydroxyl group (HO), and a hydrogen atom (H). This chiral center is further connected to another chiral center, which is bonded to a hydroxyl group (HO), a hydrogen atom (H), and a sugar moiety. The sugar moiety is a pyranose ring with hydroxyl groups (OH) at the 2, 3, and 6 positions, and a methyl group (SMe) at the 5 position. The substituent R is defined as R = CH₂CH₂CH₃.

Lipoteichoic acids

L-45

X = H, D-Ala, Glycosyl

Poly(glycerophosphate) lipoteichoic acids are the most widespread, and have a glycolipid group which may vary within a genus or in a species-specific manner. The poly(glycerophosphate) chain is unbranched and contains 16-40 glycerophosphate residues. Position 2 of the glycerophosphate chain is substituted in part with D-alanine and glycosyl residues (typically Glc, Gal, and N-acetyl-D-glucosamine). Generally all the chains are partially substituted and D-alanine and glycosyl substituents are found on the same chains. Components of the cytoplasmic membrane of gram-positive bacteria. Potent immunogens, stimulate the release of cytokines from blood monocytes and murine peritoneal macrophages. Lipoteichoic acids from *Staphylococcus* spp. induce nitric acid synthase *in vivo* and show antitumour props. prob. by induction of tumour necrosis factor.

MW ca. 30,000. A glycoprotein consisting of two subunits designated α and β. It contains about 20% carbohydrate residues. Ovine LH-α is a polypeptide chain of 96 amino-acid residues having two carbohydrate moieties. Secreted by the anterior pituitary gland. In the male, stimulates testicular Leydig cells to secrete androgen. In the female it stimulates ovulation of the ovarian follicle and formation of the corpus luteum, which secretes progesterone. Preps. isol. from urine of postmenopausal women are used in the treatment of infertility (Menotropin BAN, INN, USAN).
